

## FIX-O-FLEX

**FIX-O-FLEX** is a non-hazardous product used for sealing joints in building construction, connection, dilatation joints inside and outside, and for permanent elastic sealing. It can be applied to wet surfaces and used in underwater conditions as well as for bonding water expanding rubber profiles such as TPH HYDROTITE and HYDROSEAL.

**FIX-O-FLEX** is a pasty adhesive sealing compound which hardens through humidity to a flexible product. It should be sprayed steady with force on the bonding area. It comes in 290 ml cartridges and 600 ml aluminum foil sausages. Larger packaging is available upon request.

**PUR-O-STOP FS** is a fast reacting, rigid, two-component (Component A or Component B) injection resin for waterproofing and stabilisation of water-bearing structures like rock, ground, and sand, as well as stopping in-rushing of water in tunnels, shafts, dams, and other building structure made from concrete or brickwork. Due to its viscous and hydrophobic mixture, it penetrates well into structures sealing it and preventing water infiltration. At borders of resin/water, the mixture develops a stable and solid foam.

Both components are of liquid consistency. When applied they are taken directly from the original packaging using a 2k injection pump and mixed homogeneously in a static mixer. The injection is done by a packer or injection lances.
