

## Injection Technology

**RUBBERTITE** is three-component, water expanding hydrogel on acrylate or methacrylate basis that hardens to a rubber-like, flexible product. It can be applied for curtain grouting, surface injection in brickwork and sandstone, crack injection in reinforced concrete structures, horizontal barriers, and ground stabilisation.

**VARIOTITE** is an injection technology used for curtain grouting, for renovation of expansion joints in combination with POLINT, and for stopping water seepage. It has a rapid-reacting three-component acrylate or methacrylate gel with very good elongation properties.

**SOLIDCRYL** is a four-component injection gel on an acrylate or methacrylate basis which hardens to form a product with compressive strength. Solidcryn is used for soil and stone stabilisation, for consolidation of water saturated sand in addition to masonry injection. Due to its high-quality material basis, Solidcryn has good chemical resistance to many acids, alkalis, solvents, adhesives, etc. in its hardened condition.
